

Remarks

Release notes with changes since version 6.2.21.

Upgrade Notes:

No special actions are required when upgrading from Appway 6.2.21 to 6.2.23.

Appway Platform (Core)

Change

Area	Importance	Description
Shutdown	Low	Background activities of the process engine like process threads and the process job scheduler are now stopped very early during the shutdown procedure. If a process thread is currently executing a process job, Appway waits for a maximum of 20 seconds before continuing with the shutdown procedure. If the thread has not stopped in this time span, an error message is written to the log files: "Process Thread has not stopped: <ThreadInfo>".

Bugfix

Area	Importance	Description
Data Table	Low	When changing a page, the table now resizes to ensure that the layout of open interlines is restored. This was an issue when using an adaptive flow layout in an interline.
Refactoring	Low	Refactoring a Data Class ID was not reflected correctly in inline variable declarations such as "ForEach Data \$d In \$ds Do".
Refactoring	Low	Refactoring a Data Class ID was not reflected correctly in scripts on indexed collection instantiation types such as "Indexed Data \$d := new Indexed Data;".
Shutdown	Low	Process engine threads are no longer interrupted during shutdown. If a thread is executing a process job at shutdown, job execution completes normally before the thread exits. Interrupting the thread has led to unexpected side-effects with exceptions like ClosedByInterruptException during I/O operations or IllegalMonitorStateException when accessing the business object repository. As a result, there have been empty or corrupt files or suspended process instances.
Workspace Library Builder	Low	The builder now ignores CSS properties with a URL that contains a data string (e.g. Base64). These values are no longer prepended with an absolute path.
