Remarks
Release notes with changes since version 5.3.3.

Appway Platform (Core)

💡 Feature

Area	Importance	Description
Data Table	Low	It is now possible to let the Data Table render in "Zebra"-Style. The default coloring of the rows can be changed using the two CSS-Classes "aw_datatable_even_row" and "aw_datatable_odd_row"
Data Table	Low	The table now shows loading wheels, while rows are being loaded from the server. So far the content was just white, which confused the user.

📝 Change

Area	Importance	Description
Studio	Low	Business Object Editors: Properties of defined variables in the left section are now sorted alphabetically.

🐞 Bugfix

Area	Importance	Description
Administration	Low	Validation: The global repository validation results and diff view couldn't bee opened in Internet Explorer 9 or older.
Data Table	Medium	Actions on a Data Table itself (meaning for whole rows of the table) where not executed correctly, as long as one of the actions made access to the RowObjectVariable and the table was a direct or indirect child of one of the following components during screen rendering : (For, Foreach, Include, While).
Data Table	Low	The Data Table now renders a pointer cursor (hand) for the rows, if an action for onclick is defined.
Platform	Medium	Security: Fixed SQL injection problem with JDBC and JNDI data source definitions.
Platform	Medium	Security: Neutralize CRLF sequences in HTTP response header values.
Platform	Medium	Security: Removed obsolete Word file conversion classes.
Screen Component	Low	Data Table: Styles of a DataColumn (Color, Bold) are now really applied to the rendered cell. (Case 5876)
Screen Component	Medium	Dropdown List: Several bugfixes for Dropdown List component.
Screen Editor	Low	Locked components can now not be deleted anymore. This currently applies to the five regions of the BorderLayoutManager component.
Studio	High	Business Object Editors: Fixed a memory leak in the business object editors. TitledSections left and right will no longer fill an array of entries anymore.
Studio	Medium	Library: Custom Lists can now be exported again.
Studio	Low	Log Viewer: Added the access token to the window name, so the name is unique per login (session). Like this it is avoided, that a Log Viewer will use the same window when accessing a log file with the same path.
Workspace	Low	Data Table resources are now only loaded if the component is really in use. Otherwise older browsers like IE7 that are not supported by this component might crash.
