Release Notes 5.1.1.t - Official Release | 18.09.2014

Remarks
Release notes with changes since version 5.1.1.s.

Upgrade Notes:
Appway 5.1.1.t requires Java 1.6 or newer by default. If you run Appway with Java 1.5 please
contact support@appway.com to receive a build compatible with Java 1.5.

Appway Platform (Core)

Change

Area	Importance	Description
Workspace	Low	Screenflow instances with a maximum inactive interval now get marked as modified with every HTTP request. By default, only standalone non-persistent screenflow instances (e.g. portal screenflow instances) have a maximum inactive interval. This change prevents a premature deletion of standalone screenflow instances if the default maximum inactive interval is set to a low value like 2 hours or less.

Bugfix

Area	Importance	Description
Security	High	A security flaw related to access on files on the class path has been fixed. Please contact support@appway.com for further details.
Web Application	High	The library "stax-api-1.0.1.jar" is no longer included in the WAR file due to a compatibility issue with STAX API built into Java 1.6. Embedding this library has lead to exceptions at runtime when trying to invoke a web-services via Axis2 in an extension.
